The AV3 unit at the Danube Refinery has resumed operations at full capacity

MOL Plc. ("MOL") hereby notifies the capital markets of the following:

MOL has successfully restarted the AV3 crude oil distillation unit at the Danube Refinery, which was severely damaged in a fire on October 20, 2025.

Following the restoration, which lasted nearly a year and was carried out with a budget of approximately 18 billion forints (USD 56 million), the unit is once again operating at full capacity. The restoration did not involve any capacity expansion; the AV3 unit has resumed production with its original technological capacity.

"Today is an important day in the history of MOL and the Danube Refinery. Through extremely intensive work, we managed to complete the restoration of our AV3 unit by the planned deadline. This would be a huge achievement in and of itself, but it is particularly important now, given the current energy market environment burdened by global supply disruptions. With the restart of the AV3 unit, we are once again able to operate at full refinery capacity. This further increases MOL's supply capacity and strengthens the security of fuel supply for Hungary and the entire region. I also consider it an extraordinary achievement that, over the past year, we were able to ensure a continuous fuel supply for our country despite a significant loss of capacity at the Danube Refinery. The country did not have to face a fuel shortage. This is a major achievement, but the work is not over: ensuring safe operations and preventing similar accidents remains our primary responsibility," said Zsolt Hernádi, Chairman-CEO of MOL Group.
